

Abstract of the Disclosure

5 The present invention relates to apparatus
and methods for adapting a mobile unit to communication
requirements of a particular country or geographic
10 region. A wireless local area network communications
system may include access points and remote terminals.
Remote terminals may use country-specific information
in messages from an access point to adapt to the
communications requirements of the country in which the
15 access point is operating. The country-specific
information may be in a broadcast transmission or a
message sent in reply to a remote terminal probe
message. The country-specific information may include
operating requirements such as channel information,
20 power information, country name, modulation
information, etc.
